

Objective: Achieving consistently high levels of productivity has been a challenge for Mars surface missions. While the rovers have made major discoveries and dramatically increased our understanding of Mars, they require a great deal of interaction from the operations teams, and achieving mission objectives can take longer than anticipated when productivity is paced by the ground teams' ability to react. We have conducted a project to explore technologies and techniques for creating Self-Reliant Rovers: rovers that are able to maintain high levels of productivity with reduced reliance on ground interactions. This paper describes the design of Self-Reliant Rovers and a prototype implementation that we deployed on a research rover. We evaluated the system by conducting a simulated campaign in which members of the Mars Science Laboratory (Curiosity rover) science team used our rover to explore a geographical region. The evaluation demonstrated the system's ability to maintain high levels of productivity with limited communication with operators.

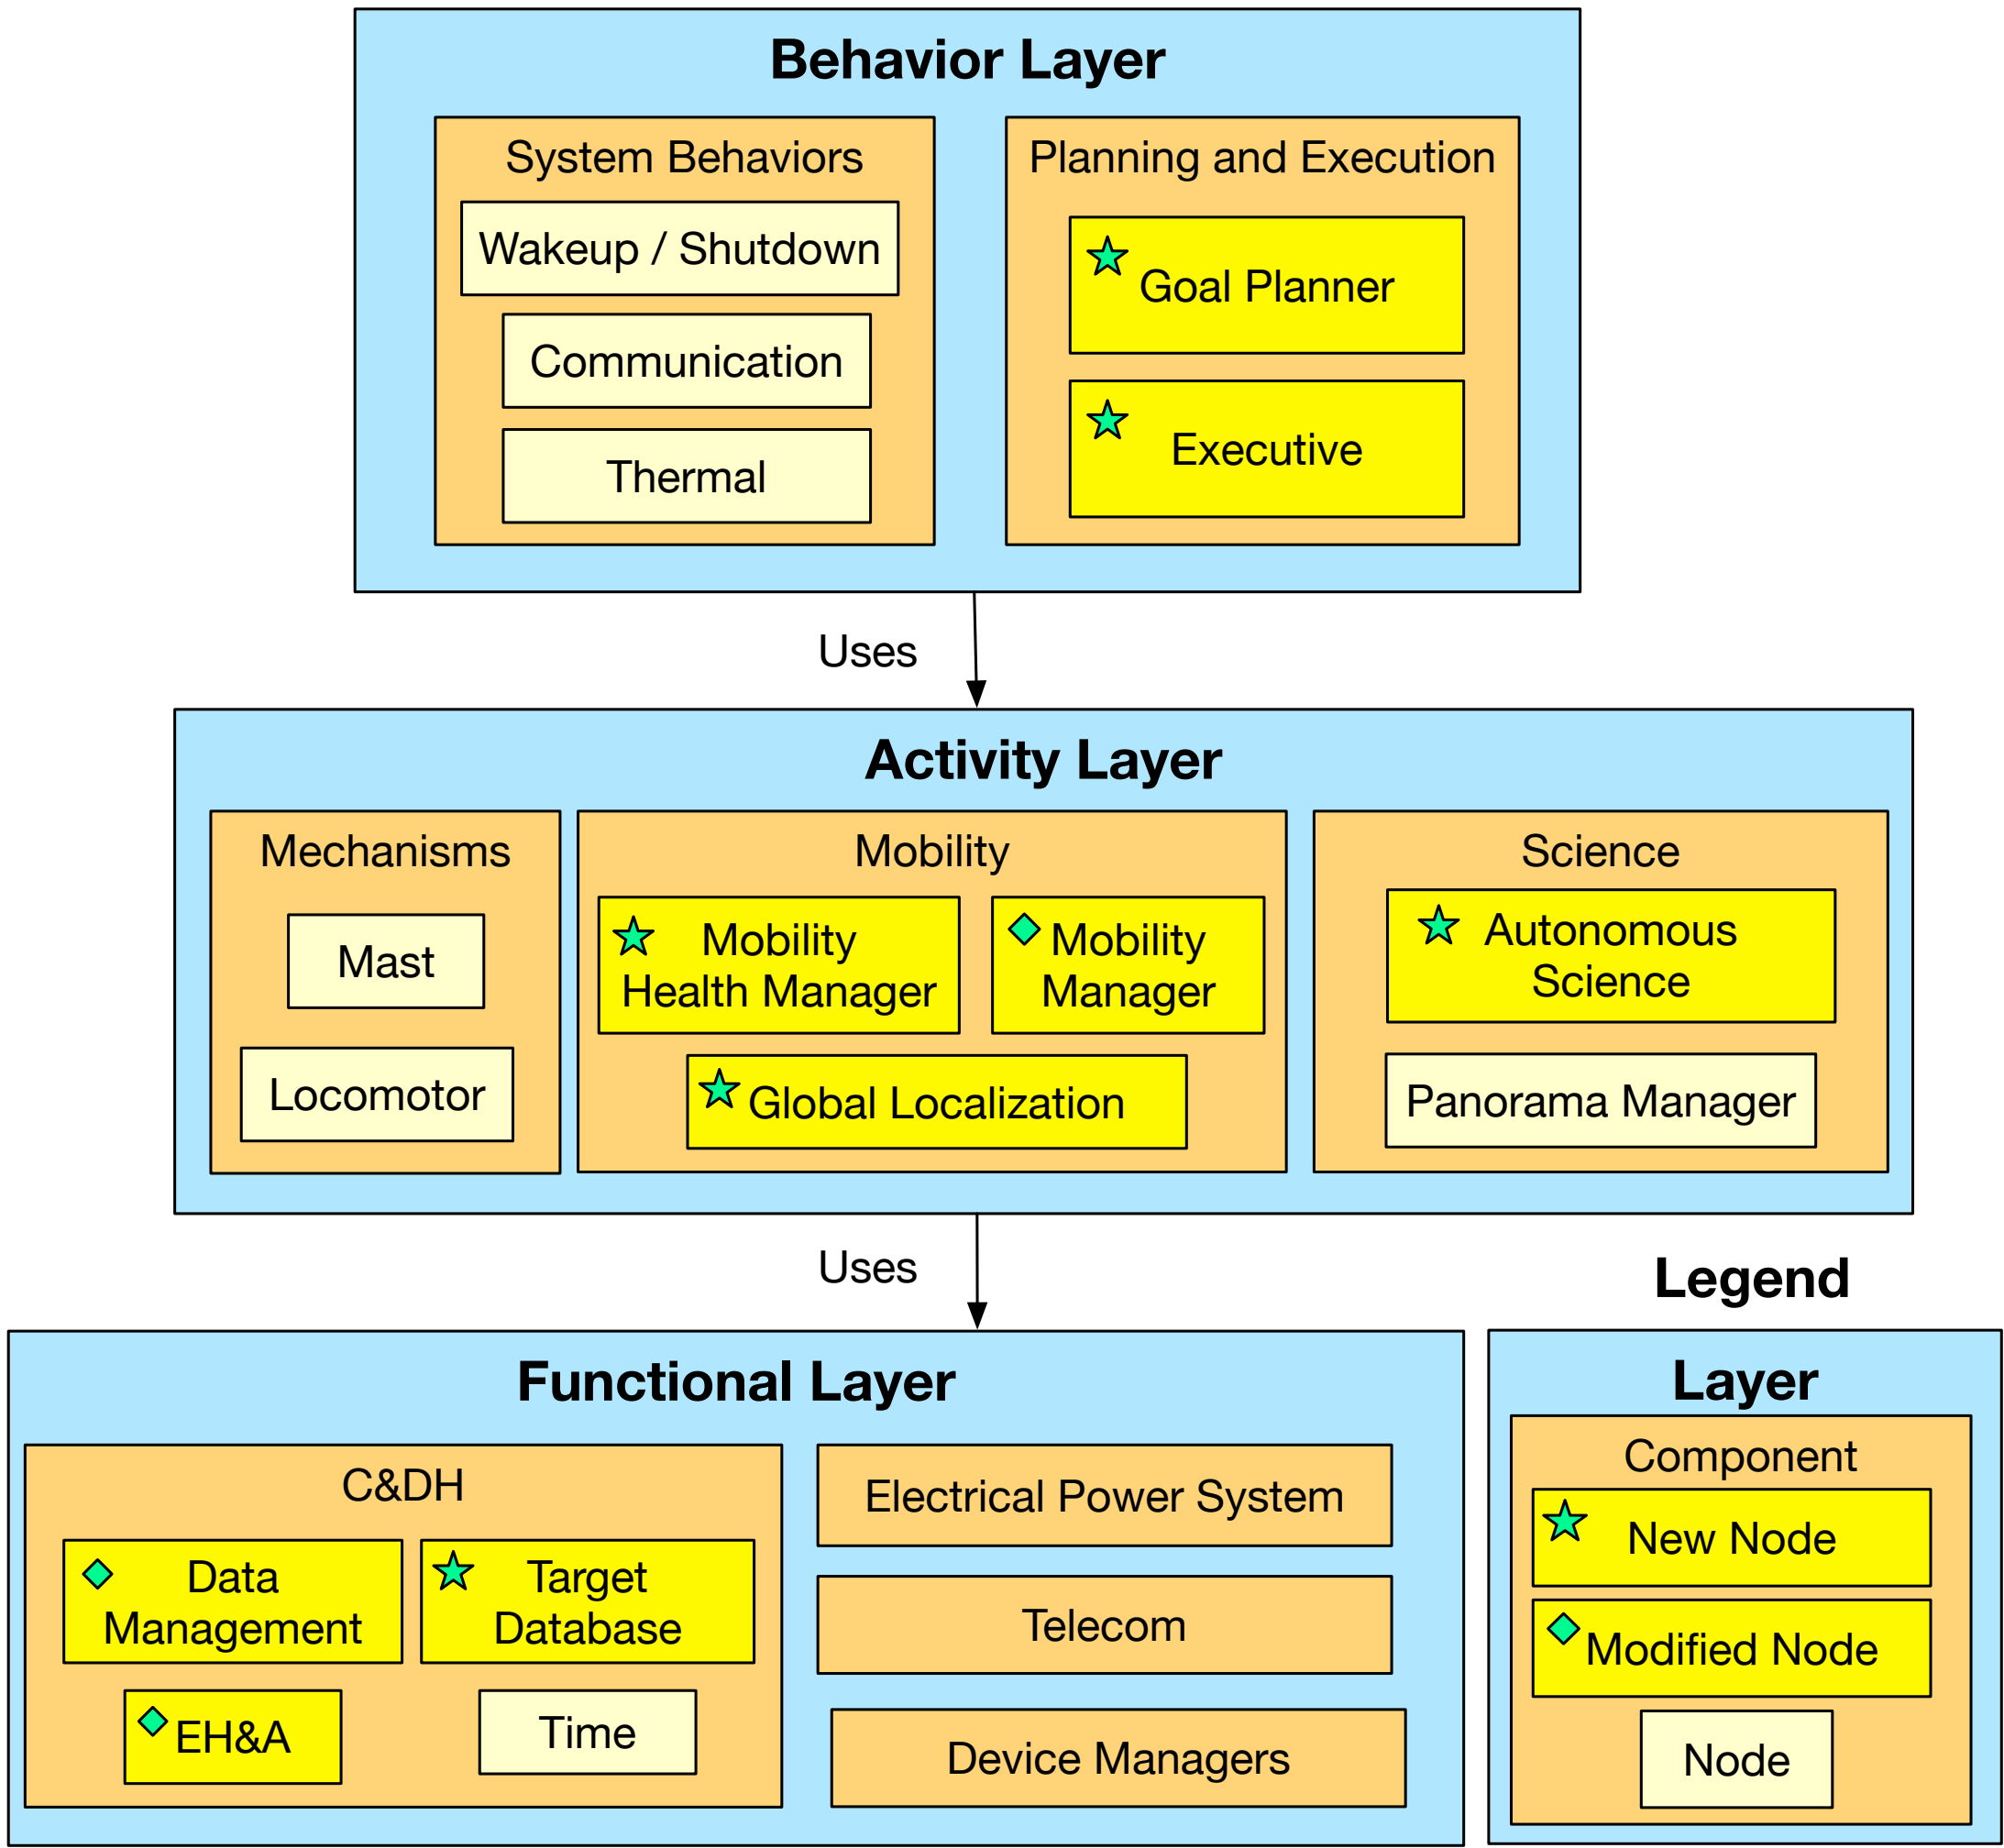

- Results:**
- Integrated Self-Reliant Rover system deployed on Athena research rover
 - Includes: goal planning, scientist-guided autonomous science, global localization, slip-aware navigation, mobility health assessment
 - Conducted Mars Yard Walkabout campaign to evaluate Self-Reliant Rover approach
 - **Mars Science Laboratory mission scientists** used rover to conduct a walkabout of Mars Yard
 - **Showed significant improvement in productivity** compared to current operations
 - 80% reduction in sols to complete campaign
 - 267% (3.7x) increase in number of locations surveyed

- Benefits:**
- Self-Reliant Rover approach addresses significant productivity challenges
 - Provides simpler, more intuitive interface, reducing operations overhead
 - Enables high levels of productivity even when ground-in-loop is not available
 - Enables vehicle to safely, robustly respond to unexpected conditions
 - Benefits for missions:
 - Increase science during long-range traverses
 - Reduced overhead in walkabout exploration of regions of interest
 - Robust, multi-sol navigation

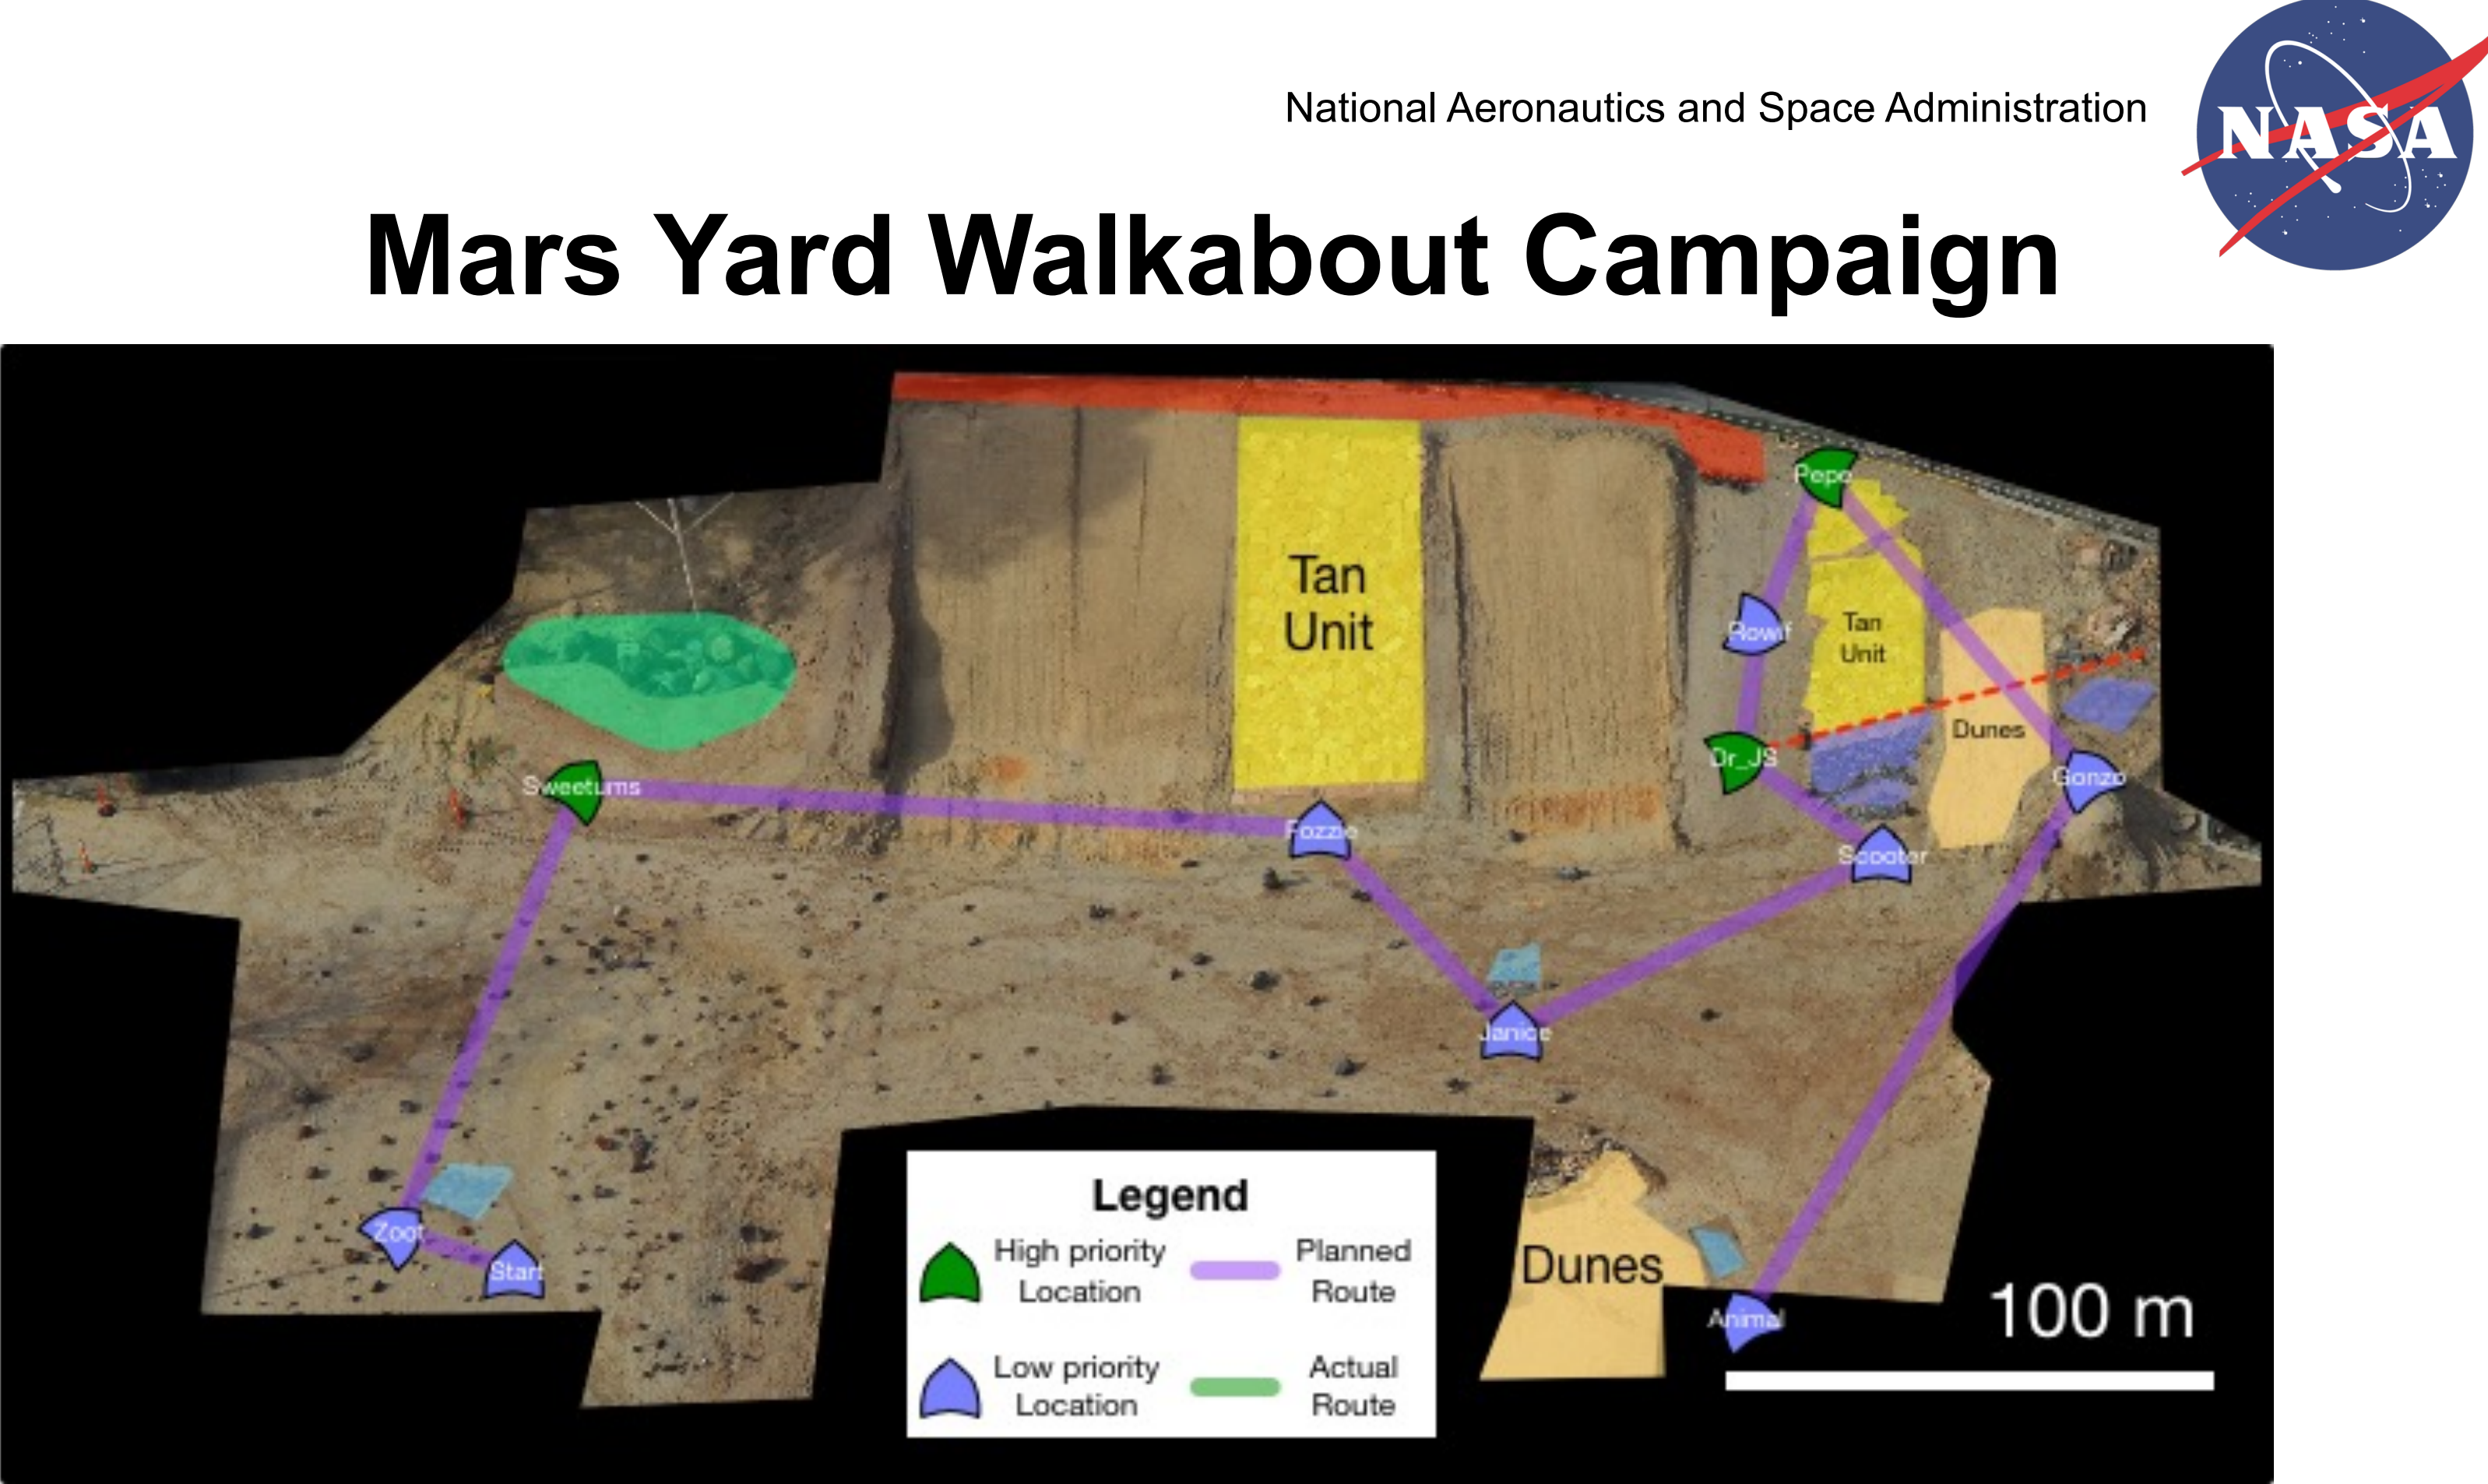

Self-Reliant Rovers for Increased Mission Productivity
